ABSTRACTS FROM REFERATIVNYY ZHURNAL - BIOLOGIYA, No. 1, 1959

This report consists of complete translations of those entries in the Soviet Biology Abstracts Journal No. 1, 1959, which were originally published in the Sino-Soviet bloc and in Yugoslavia.

The Soviet subject classification system used in the original Russian language abstracts has been followed in this publication.

USSR/Soil Sience - Soil Genesis and Geography.

J

Abs Jour : Ref Zhur Biol., No 1, 1959, 1312  
Author : Gerasimov, I.P.  
Inst : Academy of Sciences USSR  
Title : Geographical Observations in Japan  
Orig Pub : Izv. AN SSSR, Ser, geogr., 1958, No 2, 54-63

Abstract : Results are rendered on field observations conducted by the author during an expedition organized for participants of the Regional Geographical Conference in southwestern districts of Japan (1957). Red and yellow podzolic soils occur here, developing under evergreen forest vegetation. The morphology of these soils was identical with the red and yellow podzolic soils of the Trans-Caucasus. Eroded kinds of soil predominated here, where signs of podzolization were weakly manifested. Paddy

J

Abs Jour : Ref Zhur Biol., No 1, 1959, 1312

soils, which occurred on the lowlands, were systematically fertilized and were subjected to various ameliorations along with irrigation. These soils are distinguished by a great variety of kinds. Paddy soils could refer to a special class of "cultured" soils, i.e., experimentally created soils. A review is also given of characteristics of the soil of artificially drained sections of the sea coast (low fertile land), typical mountain-forest soils under mixed forests of deciduous and coniferous species with evergreen underbrush, and dark-colored soils under meadow vegetation on volcanic deposits. Volcanic ash-soil developed under normal moisture conditions under grassy vegetation. These belong to the black subtropical soil type. A more precise scheme is suggested for the soil-geographical districting of the Japanese territory.  
-- P.V. Shramko

Title : Plan of District division of Soils of China

Orig Pub : V sb.: Fiz. geogr. rayonirovaniye Kitaya, M., Izd-vo in. lit., 1957, 104-130

Abstract : A plan, worked out by the Institute of Soil Districting of the Chinese Academy of Sciences, is presented for the soil district division of the Chinese territory. The following soil zones were set apart. An area of podzolic soil was designated on two districts because of the predominance in the deposit of turf-podzolic and swamp soils of northeastern China and mountain wood-podzolic and mountain-meadow soils of northeastern China. The

Card 1/2

USSR/Soil Science - Soil Genesis and Geography.

J

Abs Jour : Ref Zhur Biol., No 1, 1959, 1313

chernozem soil zone was divided on an area of meadow, leached, carbonated black earth, and gray forest soils. The zone of chestnut soils included areas with a predominance of natural chestnut soils. In this zone there were also encountered brown, gray-brown, yellow-brown, and brown soils. In the zone of grown forest soils there prevailed mountain-forest brown, mountain turf-podzolic, mountain-meadow, and mountain-steppe soils. Alluvial soils were found here as well on lowlands of the Yantze and Yellow rivers. The zone of red and yellow soils united the area of yellow, red, laterite soils with the area of violet, Shauhsiang/<sup>?</sup> and paddy soils. In the zone of sierozem and desert-steppe soils there exist the desert-steppe and saline soils of Inner Mongolia, the saline soils and sands of the Tarim and Ala Shan desert, the sierozem of southern Dzungaria. -- S.A. Nikitin

Title : Soil-Geomorphological Districting of Leningradskaya Oblast'

Orig Pub : Sb. rabot Tsentr. muzeya pochvoved. AN SSSR, 1957, vyp. 2, 102-112

Abstract : Within the boundaries of Leningradskaya Oblast' the following soil-geomorphological areas were distinguished: the Karelian Isthmus, the shore of Lake Ladoga, area of the Gulf of Finland and the Chucksce Sea, the Silurian plateau, western Leningrad Plain, the Volkhov (near Lake Ilmen) Lowland, Valdai Hills, area of Lake Onega. Agricultural areas generally coincided with the soil-geo-

Card 1/2

Title : Buried Soils in Loess Stratum of the Ukrainian SSR

Orig Pub : Nauk. zap. Kiivs'k. un̄t, 1957, 15, No 10, 17-21

Abstract : In loess deposits of the Ukraine there were encountered buried chestnut soil, chernozem (south, middle, thick, and extra thick), gray forest soils, podzolic and meadow-bog soils. These types of soils had a regional as well as a latitudinal and vertical distribution and could serve as an excellent criterion for stratigraphic differentiation of loess strata and the study of the genesis of loess deposits.

Title : Some Mechanisms in the Development of Solonetz,  
Solonchak, and Soloth Soils.

Orig Pub : Dokl. Mosk. s.-kh. akad. im. K.A. Timiryazeva, 1956,  
vyp. 25, 230-236

Abstract : Consideration is given to the physical and chemical  
(K.K. Gedroits) and biological (V.R. Williams) theories  
of solonetz, solonchak processes of soil formation and  
solodizatio of the soil. Soils of the droughty regions  
are characterized to different degrees by the manifested  
solonetz, solonchak, and solodized conditions of the soil.  
Prevalence of one of these processes indicated only that

Card 1/2

USSR/Soil Science - Soil Genesis and Geography.

J

Abs Jour : Ref Zhur Biol., No 1, 1959, 1322

the condition of soil formation is more pronounced in  
this one direction than the other. In soil classifica-  
tion it is necessary to take into account not only the  
basic process (solonetz, solonchak formation, or solodi-  
zation) but also the accompanying processes. -- S.A.  
Nikitin

Title : Gray-Brown Desert Soils Surrounding Western Issyk-Kul'

Orig Pub : Tr. Otd. pochvoved. AN KirgSSR, 1958, vyp. 7, 21-57

Abstract : A description is given of the conditions of soil formation and soil deposits around western Issyk-Kul'. The gray-brown soils predominating in this district are classified approximately according to species, subspecies, and varieties [this corresponds only roughly with series, types and places]; in addition there is taken into account the steppe and type of alkalinity of the soil, the depth of stratification of the salt horizon, the extent of the structural, and the mechanical composition. The

Card 1/2

USSR/Soil Science - Soil Genesis and Geography.

J

Abs Jour : Ref Zhur Biol., No 1, 1959, 1324

morphology of the soil is described, and data is given on the determination of the mechanical composition, pH, humus content of the water-soluble salt, gypsum,  $\text{CO}_2$  of carbonates, active forms of N, P, and K, and the state of the absorbed bases. Features of the described soils, which are similar to the gray-brown soil of Ust'-Urt Plateau and Mongolia, are noted. It is shown that cultivation of agricultural plants and woody plants is possible on the gray-brown soils surrounding Issyk-Kul'. --

Title : Soils of Kazakhskiy Rayon and Their Agricultural Utilization

Orig Pub : Nauchn. konferentsii aspirantov AN AzerbSSR. Baku, AN AzerbSSR, 1957, 224-235

Abstract : In Kazakhskiy Rayon of Azerbaydzhan in the middle course of the Kura River there are brown forest and steppe gray-brown soils, carbonated chernozems, dark chestnut, chestnut solonetz, irrigated, meadow, incompletely developed), and meadow-bog soils. The brown forest, heavy clay soils are distinguished by a high carbonate content in the lower horizons ( $\text{CO}_2$  -- 8 - 11.5%) and by a humus content

Card 1/2

USSR/Soil Science - Soil Genesis and Geography.

J

Abs Jour : Ref Zhur Biol., No 1, 1959, 1325

of 7.9% in the upper horizons and 0.40% nitrogen.  
The brown steppe soils contain ~ 5% humus, 9.7 - 12.3%  
 $\text{CO}_2$ , 0.29% N. The latter are also highly fertile soils.  
The gray-brown soils contain 5 - 6% humus. The soils  
are suitable for vineyards. -- S.A. Nikitin

Title : Pine Forest Soils of Southern Part of Irkuskaya Oblast'

Orig Pub : Tr. Vost.-Sib. fil. AN SSSR, 1957, vyp. 5, 61-115

Abstract : In Ziminskiy and Tulunskiy Rayons of Irkuskaya Oblast' a study was made of soils formed under the influence of low relief, brisk continental climate, grassy or mossy pine forests with admixture of larches, birches, and aspens. The soil-forming rocks are composed of alluvial and diluvial sands, sandy loams, average and heavy loam, and later Cambrian sandstone. All layers are poor in silicon and rich in primary minerals. The richness of the layers in bases, the small amounts of precipitation

Card 1/2

USSR/Soil Science - Soil Genesis and Geography.

J

Abs Jour : Ref Zhur Biol., No 1, 1959, 1332

(~400 mm annually), and the grassy vegetative cover prevent development of the podzolic-forming process. The author isolated 3 groups of soil: 1. Dark gray and gray forest soils of varying degrees of podzolic content. In comparison with European soils they were characterized by a higher humus content, less width of the humus horizon, and less podzol content. 2. Weakly podzolic soils of light mechanical consistency. They were marked by a deficiency of Al and an accumulation of Fe in the upper horizons. The latter feature connects them with brown forest soils. 3. Turf-podzolic soils. They were distinguished by a marked loss of bases and sesquioxides from podzolic horizons. This loss of biogenic accumulation was not compensated. Gray forest soils can form under recent vegetation at the same time that turf-podzolic soils are forming under dark coniferous mossy taiga which previously covered the investigated territory. -- T.A.

Title : Carbon Dioxide in Soil Solution and Its Role in Soil Formation

Orig Pub : Pochvovedeniye, 1957, No 7, 65-72

Abstract : Soil solutions were studied on podzolic soils (arable and virgin soil) at the "Ruch'i" Sovkhoz and at Siverek Experimental Forest in Leningradskaya Oblast'. Serrated lysimeters, which completely kept out atmospheric air, were used to extract the solutions. The concentration of CO<sub>2</sub> in the solution reached 200 - 300 mg/liter. Total acidity of the solution was determined almost always according to the CO<sub>2</sub> content. In the period of excessive soil dryness the carbon dioxide regime was an important element in soil formation, because it generated a

Card 1/2

Title : Accelerated Determination of the Soil Moisture by a Pressure Method

Orig Pub : Pochvovedeniye, 1957, No 8, 79-85

Abstract : A method of determining soil moisture by means of wet compression is described. A weighed portion of soil  $a_1$  with unknown moisture  $W$  was moistened on a package of filter paper and then compressed. After compression the weight of soil  $a_2$  was determined. Moisture was calculated according to the formula  $W = \frac{a_1(100 + m)}{a_2} - 100$ ,

where  $m$  is the maximal molecular moisture capacity (MMC), determined by the compression method by means of dampening the soil on the filter. The absolute error in the

Card 1/2

## USSR/Soil Science - Physical and Chemical Properties of Soil.

J

Abs Jour : Ref Zhur Biol., No 1, 1959, 1354

interval of measuring the moistness of 5.77 - 53.7% consisted of 1.17 to -1.17%. By the dry compression method the known portion of soil (4 g) was maintained under pressure of  $66 \text{ kg/cm}^2$  for ten minutes between the packages of filter paper. The unknown moisture was determined according to the weight of the soil specimen after compression using a calibrated graph drawn earlier. In the moisture interval of 5.7 - 36.6% the absolute error was equal to -0.2 to 0.8%. The wet compression method was applied at any interval of wetness, the method of dry compression was used practically from hygroscopic moisture to complete water capacity. The calibrated curve required periodic correction during the vegetative period.

Title : Content of Mobile Compounds of Iron and Aluminum in Some Soils of Hungary

Orig Pub : Agroken. es. talaj., 1956, 5, No 2, 171-182

Abstract : A study is presented on the content of mobile forms of Fe and Al in chernozem, podzolic, brown forest, turf wood-carbonate meadow, bog, and solonetz soils. Soluble forms of Fe and Al were determined using 0.05 N H<sub>2</sub>SO<sub>4</sub> and 1 N complexon (trilon B) + 1 N KCl. It was noted that the dynamics of the mobile forms of Al depended mainly on the reaction of the soil solution; the presence of aerobic or anaerobic conditions in the soil was of the utmost importance for Fe. The work was accomplished at the Budapest University. -- P.V. Shranko

Title : Conditions of Humus Storage in Soils.

Orig Pub : Materialy nauchn, konferentsiy Izhevskiy, s.-kh. in-t, vyp. 2, Izhevsk. 1958, 77-81

Abstract : Energy of decomposition of vegetative residues in the soil can be lowered when oxidizing processes prevail in it, and this is achieved by a temporary moistening of the soil. A liberal wetting of vegetative residues as soon as the plants had withered consequently impeded their aerobic decomposition and mineralization if oxidizing processes predominated, and this led to an accumulation of humus in the soil. -- M.L. Yaroshenko

Title : Enzymatic Activity of Some Types of Armenian Soil

Orig Pub : Dokl. AN ArmSSR, 1958, 26, No 1, 29-32

Abstract : Leached and mountain black earth soils were characterized by the highest enzymatic activity (7.8 - 5.3 mg of N), and the least activity was shown by light chestnut and cultivated irrigated soils (0.50 - 0.53 mg of N to 1 g of dry soil). Urease activity was lowered along the soil profile, and it was not observed in deep horizons. The application of mineral fertilizers with manure increased urease activity 2 - 3 fold. The greatest activity was observed in the rhizosphere of alfalfa,

Title : Experiments on the Preparation and an Investigation of the Effects of a Slow Acting Nitrogen Fertilizer, "Ureaform"

Orig Pub : Magyar tud. akad. agrartud. oszt. közl., 1957, 13,  
No 1-2, 113-128

Abstract : Ureaform was prepared by the following method; 3 grammes of crystalline carbamide was dissolved in 1 liter of water, the reaction of which was preliminarily brought up to a pH of 3.6 at a temperature of 25 degrees with citric acid and sodium diphosphate. The solution

Card 1/2

HUNGARY/Soil Science - Fertilization. Mineral Fertilizers.

J

Abs Jour : Ref Zhur Biol., No 1, 1959, 1375

was mixed with 37% formaldehyde so that there was 1 molecule of formaldehyde to 1.625 gram-molecules of carbamide. The solution was adjusted to a pH of 3.6 with a buffer solution. After twenty-four hours the white precipitate was filtered, washed with water, and dessicated. Field experiments were conducted on Liam soils of a humus-carbonate type. The test plant was corn for green fodder. It was found that the decomposition of ureaform was negligible, the action of nitrogen low, and the harvest was not increased. The quality of the green fodder was raised. An increased harvest was observed on test fields where ureaform was applied in combination with ammonium fertilizer. --

Title : Effectiveness of Phosphorus Fertilizer in Relation to the Saturation of the Soil with Phosphates.

Orig Pub : Udobreniye i urozhay, 1958, No 2, 25-30

Abstract : Experiments conducted on sierozems of Middle Asia (Uzbekistan SSR) showed that effectiveness of phosphorus fertilizers applied on a background of nitrogens depended on the amount of mobile P in the soil. In a vegetative experiment phosphorus fertilizers increased the harvest of cotton wool in containers with a small amount of available P in the soil (20 mg of  $P_2O_5$  per kg of soil) by 15.5 g to a container and decreased it in variants with a high amount of mobile P in the soil (50 mg of  $P_2O_5$  per kg of soil) by 8.3 - 9.6 g to a container

Card 1/2

USSR/Soil Science - Fertilization. Mineral Fertilizers.

J

Abs Jour : Ref Zhur Biol., No 1, 1959, 1391

in comparison with harvest in containers where only N was introduced. In field experiments the application of phosphorus fertilizers (40 - 80 kg/hectare of  $P_2O_5$ ) increased the number of pods by 1.7 - 1.8 on one plant and the cotton crop by .85 - 7.26 centner/hectare on plots with a low content of available soil P (20 mg of  $P_2O_5$  per kg of soil) and decreased these indicators (number of pods by 0.5 - 1.8 to one plant and the harvest by 3.74 - 4.48 centner/hectare) on plots with a high content (60 mg of  $P_2O_5$  per kg of soil) of mobile P in the soil in comparison with the harvest from plots where only N was introduced. On plots having a low content of mobile P, phosphorus fertilizers contributed toward a more intense intake of N and P in cotton plants in almost all periods of vegetation. -- O.P. Medvedeva

Title : Change in Some Physical and Chemical Properties of Virgin Black Soils with Their Treatment.

Orig Pub : Izv. vost. fil. AN SSSR, 1957, No 3, 126-134

Abstract : Investigations were conducted in the vicinity of Barnaul on 2 fields containing an 8-field vegetable-grassland crop rotation: oats and grasses, grasses, grasses, cucumbers and tomatoes, cabbage, plants with edible roots, beans, and potatoes. Observations were conducted on common chernozems according to the rotation of the bed and in the field which was the last in the crop rotation. In the arable horizon of worked soils in

Card 1/2

USSR/Soil Science - Tillage. Amelioration. Erosion.

J

Abs Jour : Ref Zhur Biol., No 1, 1959, 1406

comparison with virgin soils, there was observed an increase in the total weight of 6-7% and 1.5 - 2.5% in specific weight. In reference to pulverizing and compacting of the soil, the porosity of the arable horizon decreased 3% and 4.2% in the subarable. Maximal hygroscopicity decreased by 11.5% and the amount of moisture inaccessible for plants by 1 - 4%. The reserves of available moisture in 1 m layer of worked chernozem consisted of 1268.2 and 1369.6 m<sup>3</sup>/hectare, and on virgin soil 721.6 m<sup>3</sup>/hectare. On fields with oat crop rotation the amount of unavailable moisture in 1 m layer of soil proved greater than on fields under grain cultivation. The amount of humus in worked chernozem horizons decreased 0.48% in comparison with virgin soils, N by 12.5 - 15%, and total absorbed bases by 8%. Ca in crop rotated soils was lowered due to its loss with the plant harvest.

Title : Nature of Spring Soil Treatment in Leningradskaya Oblast'

Orig Pub : Za bysokuyu kul'turu s. kh., 1957, vyp. 1, 11-13

Abstract : For the clay, heavy, and medium loam soils in Leningradskaya Oblast' it is recommended that the soils be broken up a little in the spring instead of being subjected to a full plowing; that the bed be plowed with a colter plow instead of disking. On deeply porous soils in the spring and with additional sowing of grasses a roller should be used. Under furrowed plants it is expedient periodically (once every 3 - 4 years) to break up the subarable layer down to 30 - 35 cm. -- F.I. Shcherbak

Title : Ways of Increasing the Fertility of Solonetz Soils

Orig Pub : Izv. Timiryazevsk. s.-kh. akad., 1957, No 5, 63-90

Abstract : Experiments have been conducted since 1935 at Malo Uzen' base on average columnar solonetz soils, where  $\text{CaCO}_3$  was found at a depth of 30 cm. Best results were obtained with deep treatment of the soil (plowing to a depth of 35 cm with subsoil plowing to 15 cm). Deep plowing contributed toward a reduction in the alkalinity of the soils, formation of a more extensive spread of the root area, increase in porosity and water permeability of the soils, and general improvement of

Card 1/2

USSR/Soil Science - Tillage. Amelioration. Erosion.

J

Abs Jour : Ref Zhur Biol., No 1, 1959, 1413

their physical properties. The arable layer was enriched by colloids and  $\text{CaCO}_3$  from the deep horizons of the soil, which improved the water-air and nutrient regime of the soil and increased the  $\text{CO}_2$  content. A suggested system of agrotechnical measures for the rapid utilization of alkaline soils includes a method of soil treatment, sowing of perennial grasses, application of fertilizer, and a plan for water conservation.

Title : Soil Erosion and Control Methods in Moldavia

Orig Pub : Zemledeliye i zhivotnovodstvo Moldavii, 1957, No 6,  
14-20

Abstract : Soil erosion has damaged about 75 percent of the arable land in Moldavia. About 250 thousand hectares of this are badly eroded. To control the soil erosion processes it is recommended that cross plowing on slopes, forest planting and protective herb-strip sowing be applied. To retain precipitation which has fallen on the fallow fields strip tilling at every 10 meters should be used. It is best to protect the fallows with buffer strips. The fields which are freed from early crops might well be utilized for stubble and under-sown

Card 1/2

USSR/Soil Science - Tillage. Amelioration. Erosion.

J

Abs Jour : Ref Zhur Biol., No 1, 1959, 1424

crops. Dense sowing on slopes should be made crosswise and in tight rows. Terracing should be used on slopes which are  $12-25^{\circ}$  steep. Slopes more than  $25^{\circ}$  are much better off when occupied with tree stands. It is reasonable to have contoured stands on slopes inclined  $5-12^{\circ}$  in which the rows of plantings are arranged along the basic horizontal lines, while following the curvature of the slope. -- S.A.
